Not agile yet? Experience to be part of a scrum team

1. Deliver the right product

Focus on business value & focus on users. A close collaboration between the customer and the developer(s), as well as prioritization of the product features happening through the customer, eases the road to achieve the desired product with the greatest business value.

2. Make happy & engaged stakeholders/customers

The key stakeholders get systematically involved along the process. Regular feedback & retrospective help to align expectations and promote continuous learning. The transparency boosts trust and engagement.

3. Have fun

Individuals are more valued than processes. Empowered to decide about their own work, the team favors direct communication & close collaboration. Knowledge & information are shared. Failure becomes an opportunity to learn and that's motivating.

4. Increase productivity

Self-organized, Developers know the best how to do things and who should do what. The whole team is responsible for the quality of the delivery. Having this authority gives a sense of ownership and belonging and increases the team productivity.

5. Ensure higher quality

Incremental development allows the team to focus on manageable bits. The User Stories, which describe the features of the product, should contain the acceptance criteria to validate the implementation. Routine technical testing & UAT (User acceptance Testing) helps to catch & fix issues at early stage.

6. Enable flexibility

In the Agile approach, being reactive to changes is more important than following the plan. Each iteration offers the opportunity to refine or to re-prioritize the requirements.

7. Profit from continuous delivery

Cyclic deliveries allow iterative improvements & adjustments. The Product Owner takes decisions continuously, which get validated continuously as well, reducing the risk to smaller bits. Predictable, the delivery is expected at the end of the iteration, usually fixed to a 1 to 4 weeks cycle.

'Not agile yet?'

Register Now!

- Be actively part of a scrum team
- Engage for a development following an agile approach
- Write a user story
- Participate to a refinement meeting
- Help to prioritize
- Be part of a sprint planning
